Background:

Aims, Definitions, & Data Source Information

Welcome to my happiness dashboard!

Background & Rationale: This project explores factors that influence happiness around the world using both the World Happiness Report (scraped from this [site](#)) and my own happiness dataset collected over 9 months. This dashboard is designed to allow you to explore trends in how different countries rank for predictors of happiness around the world. Additionally, this dashboard includes a tab exploring my own habits and how they've contributed to my happiness ratings. I hope this dashboard is as fun to play around with as it was to build - Happy Analyzing!

Data Sources: World Happiness Report, my own happiness dataset

Dashboard Objective:

1. To analyze factors that predict happiness ranking (global factors)
2. To analyze the impact of different habits on my own happiness score (individual habits)

Date Range: World Happiness Report: 2015-2025 (score refresh = annual) My happiness dataset: July 2025-March 2026 (score refresh = daily)

BONUS: If you found this dashboard interesting, I have a longer analysis pulling out some key trends from these data and providing a predictive model on what drives happiness! Check out my Google Colab Notebook for the analysis here. If you're interested in more examples of my (super cool) technical work, you can find my GitHub [here](#).

Data Dictionary | World Happiness Report

- Life evaluation**: The global ranking is based on a single life evaluation question: Please imagine a ladder with steps numbered from 0 at the bottom to 10 at the top. The top of the ladder represents the best possible life for you and the bottom of the ladder represents the worst possible life for you. On which step of the ladder would you say you personally feel you stand at this time? This variable can be used as a proxy of happiness ranking.
- Change avg**: The change in average life evaluation since the first ranking was published in 2012.
- Inequality**: The standard deviation of life evaluation scores. Countries with a higher standard deviation have a wider spread of scores which indicates greater inequality in happiness.
- Social support**: If you were in trouble, do you have relatives or friends you can count on to help you whenever you need them, or not? The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country in which respondents felt they had the least social support and the max ranking is the country in which respondents felt they had the most social support.
- GDP per capita**: In terms of Purchasing Power Parity adjusted to constant 2017 international dollars, taken from the World Development Indicators by the World Bank. The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country with the highest GDP per capita that year and the max value is the country with the lowest GDP per capita that year.
- Healthy life expectancy**: Based on data from the World Health Organization Global Health Observatory. The most recent data is from 2021. The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country in which respondents had the highest expectancy of a healthy life and the max value is the country in which respondents had the lowest expectancy of a healthy life.
- Freedom**: Are you satisfied or dissatisfied with your freedom to choose what you do with your life? The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country where respondents felt they had the most freedom to choose what to do with their lives and the max value is the country where respondents felt they had the least freedom to choose what to do with their lives.
- Generosity**: Have you donated money to a charity in the past month? The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country where the most respondents indicated they had donated in the past month and the max value is the country where the least respondents indicated they had donated in the past month. **Same as Donated**
- Perception of corruption**: The average of two questions: “Is corruption widespread throughout the government or not?” and “Is corruption widespread within businesses or not?” Where data for government corruption are missing, the perception of business corruption is used as the overall corruption-perception measure. The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 the country in which the most respondents indicated corruption was low and the max value is the country in which the most respondents indicated corruption was high.
- Positive emotions**: The national average of binary responses (0=no, 1=yes) about three emotions experienced on the previous day: laughter, enjoyment, and interest. The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country with the highest frequency of positive emotions experienced by respondents on the previous day and the max value is the country with the lowest frequency of positive emotions experienced by respondents on the previous day.
- Negative emotions**: The national average of binary responses (0=no, 1=yes) about three emotions experienced on the previous day: worry, sadness, and anger. The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country with the highest frequency of negative emotions experienced by respondents on the previous day and the max value is the country with the lowest frequency of negative emotions experienced by respondents on the previous day.
- Donated**: Have you donated money to a charity in the past month? The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country where the most respondents indicated they had donated in the past month and the max value is the country where the least respondents indicated they had donated in the past month. **Same as Generosity**
- Volunteered**: Have you volunteered your time to an organisation in the past month? The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country in which the most respondents had volunteered their time to an organization in the past month and the max value is the country in which the least respondents had volunteered their time to an organization in the past month.
- Helped a stranger**: Have you helped a stranger or someone you didn't know who needed help in the past month? The score represents how that country ranks for that variable amongst all countries surveyed that year where 1 is the country in which the most respondents had helped a stranger in the past month and the max value is the country in which the least respondents had helped a stranger in the past month.

Data Dictionary | My dataset

- Date**: The day the happiness score relates to. All columns with a 'True' value on a date were practiced.
- Happiness Rating**: A rating of my happiness that day from 1-10 where 1 is the worst day ever and 10 is the best day of my life.
- Practiced Fiddle?**: A boolean variable. A 'Yes' value means I practiced the fiddle on that date while a 'No' value means I didn't.
- Practiced a Language?**: A boolean variable. A 'Yes' value means I practiced a language on that date while a 'No' value means I didn't.
- Slept 8 hours?**: A boolean variable. A 'Yes' value means I slept at least 8 hours the night before that date while a 'No' value means I didn't.
- Meditated?**: A boolean variable. A 'Yes' value means I practiced meditation on that date while a 'No' value means I didn't.
- Exercised?**: A boolean variable. A 'Yes' value means I exercised on that date while a 'No' value means I didn't.
